Professional Summary

Software Engineer building full-stack web applications and **LLM-powered tools** in **TypeScript, JavaScript, Python, React.js, Next.js, and Node.js**. Shipped full-stack dashboard features during a three-month SDE internship, owning both the Next.js API routes behind them and the React interfaces on top, and built a lens-based code-review agent, shipped as a GitHub App, whose verifier lifts security precision to 1.00 on a labeled evaluation set.

Technical Skills

- **Languages:** JavaScript, TypeScript, Python, Java, SQL
- **Frontend:** React.js, Next.js, Tailwind CSS, Zustand (State Management)
- **Backend:** Node.js, Express.js, Next.js API Routes, FastAPI, RESTful APIs, JWT Authentication
- **AI & LLM:** OpenAI API, RAG, Vector Databases (Chroma), Prompt Engineering, LLM Evaluation (Precision/Recall/F1)
- **Databases:** MongoDB (Mongoose), PostgreSQL, MySQL, SQLite
- **DevOps & Tools:** Git, GitHub Actions, CI/CD, Docker, AWS, Linux (Bash), Claude Code

Experience

Software Development Engineer Intern

Sep 2025 – Nov 2025

CultureX Entertainment Private Limited

Onsite

- Built the Shopify Coupons Listing module end to end, from Next.js API routes to reusable React.js and Tailwind CSS components, cutting development time for new features by **30%**.
- Implemented Link Tracker across the stack, writing server-side data flows with Next.js API routes and Server Actions plus the dashboard UI that consumed them, giving users real-time engagement visibility.
- Engineered global state management with Zustand and enforced type-safety with Zod, reducing runtime UI errors by **25%**.
- Improved Core Web Vitals by restructuring components and adding analytics instrumentation to locate slow render paths.
- Reviewed pull requests and shipped weekly releases in an Agile team workflow.

Projects

Code Review Agent: Lens-Based PR Reviewer and GitHub App

[\[Demo\]](#) | [\[GitHub\]](#)

Python, OpenAI API, RAG, tree-sitter, FastAPI, Next.js, SQLite, Docker, GitHub Apps & Actions

- Built an advisory PR reviewer from seven narrow lenses (security, correctness, dependencies, performance, infra, tests, maintainability), each gated on its own labeled eval set at ≥ 0.80 precision over three runs before it ships on by default.
- Added a verifier that must quote the added lines or withdraw, raising security precision from **0.87 to 1.00** at 0.99 recall; cross-file context (tree-sitter chunks, numpy store) had raised F1 from **0.82 to 0.914**.
- Shipped one-click fixes (100% of proposals parse and pass on ten mechanical cases), a PR summary, per-repository memory of rejected findings, and a GitHub App with a webhook worker and Next.js dashboard beside the CLI, pre-push hook and Action.

JobPilot: AI Job Discovery & Company Research Agent

[\[Live\]](#) | [\[GitHub\]](#)

Next.js 16, React 19, TypeScript, GPT-4o, PostgreSQL, Browserbase, Stagehand, Adzuna API

- Built and deployed a full-stack AI job agent that discovers live postings and scores each 0–100 against the user's resume, surfacing matched and missing skills.
- Automated company research with a headless browser session that crawls employer pages into a structured dossier; each phase degrades gracefully, so a dead link costs one section, not the run.
- Designed a four-table relational schema with per-user row-level security, plus PDF resume parsing and generation and a dashboard charting activity from the database rather than analytics events.

Education

Bachelor of Technology in Computer Science & Engineering (AI & ML)

SAL Institute of Technology and Engineering Research

Expected Graduation: 2027

Gujarat, India
